

a PAMPA permeability assay (conceptual)

b Representative cyclic peptides by PAMPA permeability

$\log_{10}(\text{Pe} / \text{cm s}^{-1})$; less negative = higher permeability

Low permeability	Medium permeability	High permeability
PC-1026 -7.20 Desmethyldestruxin B -6.67	Destruxin B -5.29 Cyclosporin A -5.01	Enniatin B -4.73 Patellamide C -4.72
Typical features • Larger / bulkier • Higher polarity • Often ionizable	Typical features • Intermediate size • Moderate polarity • Often neutral or weakly ionizable	Typical features • More compact • Lower exposed polarity • Mostly neutral
